*Management of Warm Compresses for Reducing Dysmenorrhea Pain in Adolescents  
at the Karang Anyar Health Center*

**ABSTRACT**

Dysmenorrhea is uterine pain during menstruation. Dysmenorrhea can be reduced pharmacologically and non-pharmacologically. According to the World Health Organization the incidence of dysmenorrhea is quite high, the average incidence of dysmenorrhea in young women is between 16.8 - 81%. The purpose of this care is to find out the management of giving warm compresses to reduce dysmenorrhea pain in adolescents. The care method used is warm compresses. Warm compresses can be done by attaching a rubber bag filled with warm water covered with a towel to the painful part of the body. This care was carried out for 5 adolescents who experienced dysmenorrhea on the first day of menstruation. The average pain scale before care was carried out was 5, after care was carried out the average pain scale was 3 and the average decrease in pain scale was 3.4. From the results of field care, it can be proven that giving warm compresses to the lower abdomen can reduce dysmenorrhea pain.
