**DUKUNGAN SOSIAL KELUARGA TERHADAP PENDERITA TB PARU  
DI WILAYAH KERJA PUSKESMAS CISARUNI KABUPATEN  
TASIKMALAYA**

**ABSTRAK**

xiii bagian awal + 61 halaman + 11 tabel +1 bagan +11 lampiran

TB Paru dapat sembuh secara total, apabila pasien itu sendiri mau patuh dengan aturan-aturan tentang pengobatan TB Paru. Keberhasilan pengobatan dapat dipengaruhi oleh dukungan diri sendiri serta peran keluarga. Penelitian bertujuan untuk mengetahui dukungan sosial keluarga terhadap penderita TB paru di wilayah kerja Puskesmas Cisaruni Kabupaten Tasikmalaya. Penelitian ini menggunakan metode penelitian deskriptif kuantitatif. Sampel penelitian yang digunakan sebanyak 41 orang yang diperoleh menggunakan teknik total *sampling*. Data diperoleh dengan kuesioner tertutup dan data dianalisis dengan menggunakan distribusi frekuensi. Hasil menunjukkan sebagian besar responden mendapat dukungan kurang dari keluarga sebanyak 23 orang (56.1%), sebagian kecil responden mendapat dukungan baik dari keluarga yaitu sebanyak 19 orang (43.9%). Kesimpulan dari penelitian ini adalah sebagian besar dukungan keluarga termasuk di kategori kurang mendukung. Oleh karena itu diharapkan Sebagai upaya dalam meningkatkan kepatuhan minum obat maka sebaiknya Puskesmas khususnya petugas pengelola program TB dapat meningkatkan dukungan sosial seperti dukungan emosional, penghargaan, instrumental dan informatif.

**FAMILY SOCIAL SUPPORT FOR PATIENTS WITH LUNG TB IN THE  
WORKING AREA OF CISARUNI PUBLIC HEALTH CENTER  
TASIKMALAYA**

**ABSTRACT**

xiii initial section + 61 pages + 11 tables +1 chart +11 attachments

Pulmonary TB can be completely cured, if the patient himself complies with the rules regarding pulmonary TB treatment. The success of treatment can be influenced by self-support and family roles. This study aims to determine family social support for pulmonary tuberculosis patients in the working area of the Cisaruni Community Health Center, Tasikmalaya Regency. This research uses descriptive quantitative research methods. The research sample used was 41 people who were obtained using a total sampling technique. The data were obtained using a closed questionnaire and the data were analyzed using a frequency distribution. The results showed that most of the respondents received less support from the family as many as 23 people (56.1%), a small proportion of respondents received good support from the family, namely as many as 19 people (43.9%). The conclusion of this study was that most family support was included in the less supportive category. Therefore, it is hoped that in an effort to improve compliance with taking medication, the Puskesmas, especially TB program management officers, can increase social support such as emotional support, appreciation, instrumental and informative support
